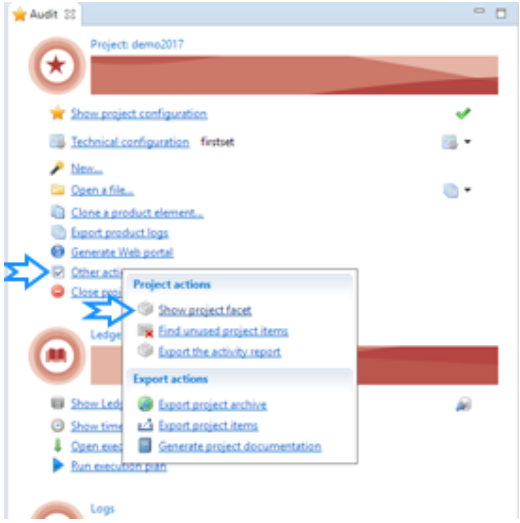
Installation documentation

Import the add-on/booster (facet file) into your project

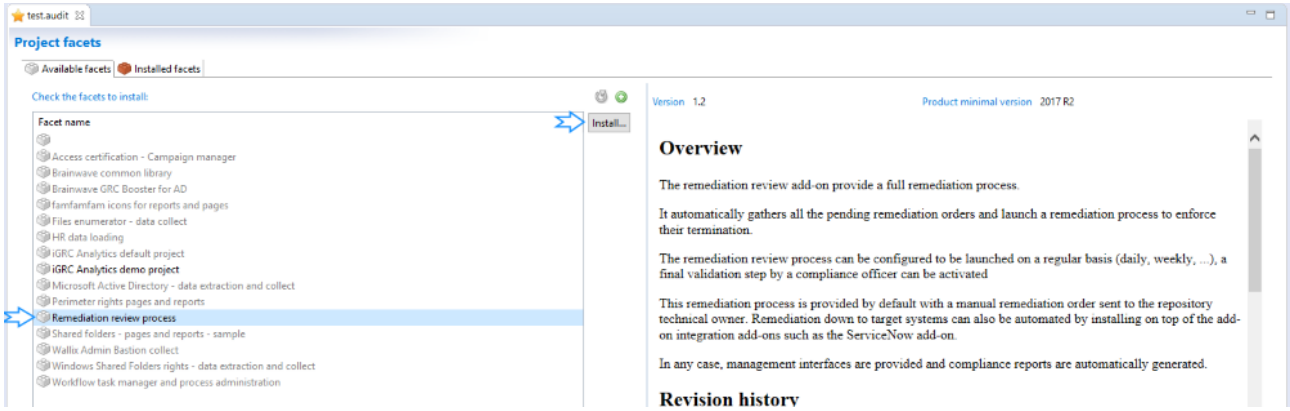
Open the Brainwave identity GRC studio, then in the tab audit on the left part of the studio, click on “Other actions” > “Show project facet” Here you have an overview on all the available facet files in your project and by clicking on the tab “Installed facets” all the installed ones.



To add a new facet file to your project, click on the green + button and import the related "*.facet" file. Then add-on name will be updated in the list available in the tab “Available facets”.

Install the add-on/booster into your project

From the “Available facets” tab, select the facet file you want to install, have a look on the right part to the dependancies, description and instructions for use and then click on the “Install” button.

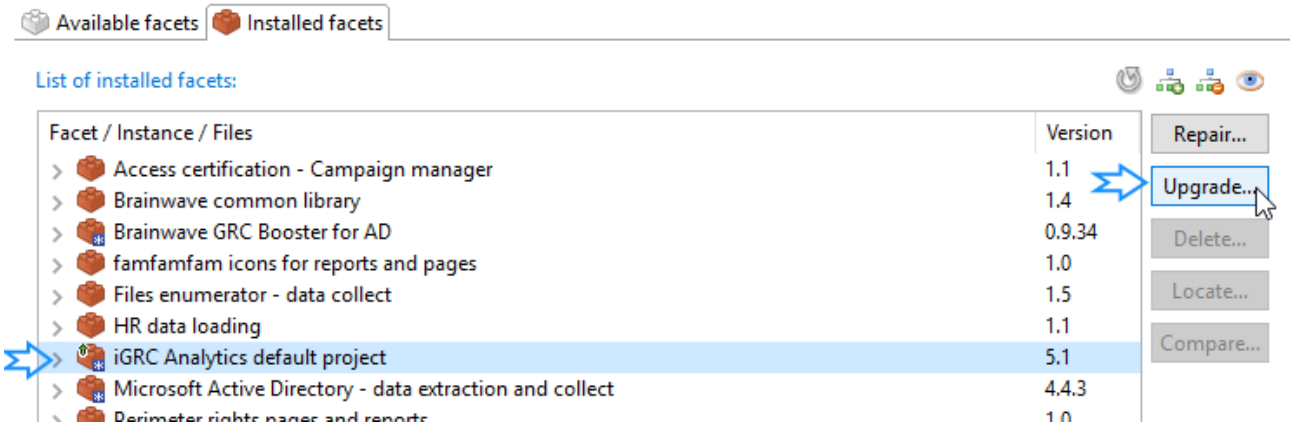


During the installation process, you may have to set variables if required. Once installed, all the add-on files will be deployed and available in your project. The installed add-on will be then displayed in the “Installed facets” tab.

Upgrade the add-on/booster into your projectimport3

If you need to upgrade an existing add-on, you have to import the new related facet file as describe in the part “Import the add-on/booster…” above. Then from the “Installed facets” tab, after selecting the related

add-on in the list, the “Upgrade” button will be available for click.



Click on the “Upgrade” button, and from the opening window, check variables when relevant and finally all the files that will be modified. You have the possibility to check the “Keep replaced files by renaming them” box if you want to save the add-on files modified by the upgrade. These files will be renamed in “.old” within your project.
